

IBM Watson Discovery – Node.js

Cognitive Solutions Application Development

IBM Global Business Partners

Duration: 90 minutes

Updated: Sep 16, 2019

Klaus-Peter Schlotter

kps@de.ibm.com

IBM

Version 1.5

Overview

The [IBM Watson Developer Cloud](#) (WDC) offers a variety of services for developing cognitive applications. Each Watson service provides a Representational State Transfer (REST) Application Programming Interface (API) for interacting with the service. Some services, such as the *Speech to Text* service, provide additional interfaces.

The Watson Discovery service adds a cognitive search and content analytics engine to applications to identify patterns, trends and actionable insights that drive better decision-making. Securely unify structured and unstructured data with pre-enriched content, and use a simplified query language to eliminate the need for manual filtering of results.

The app created in this lab can run locally or in the IBM Cloud.

- In a first step, a Watson Discovery service instance is created on the IBM Cloud.
- Next, you will adjust the IBM Cloud demo to use the German document collections
- Then the chatbot from lab 3 will be enhanced with Discovery capabilities.

Objectives

- Learn how to use the Watson Discovery service on IBM Cloud
- Learn how to utilize the Watson Discovery service APIs in Node.js.

Prerequisites

Before you start the exercises in this guide, you will need to complete the following prerequisite tasks (see the [setup guide](#)).

- Create a IBM Cloud account
- Install the required software

Section 1: Create a Discovery service instance

Step 1 In a web browser, navigate to the following URL

<http://console.ng.bluemix.net>

Step 2 Log in with your IBM Cloud credentials. This should be your IBMid.

Step 3 You should start on your dashboard which shows a list of your applications and services. Scroll down to the All Services section and click **Create Resource**.

Create resource

Step 4 On the left, under Services, **click** on *AI* to filter the list and only show cognitive services.

Step 5 **Click** on the Watson Discovery service.

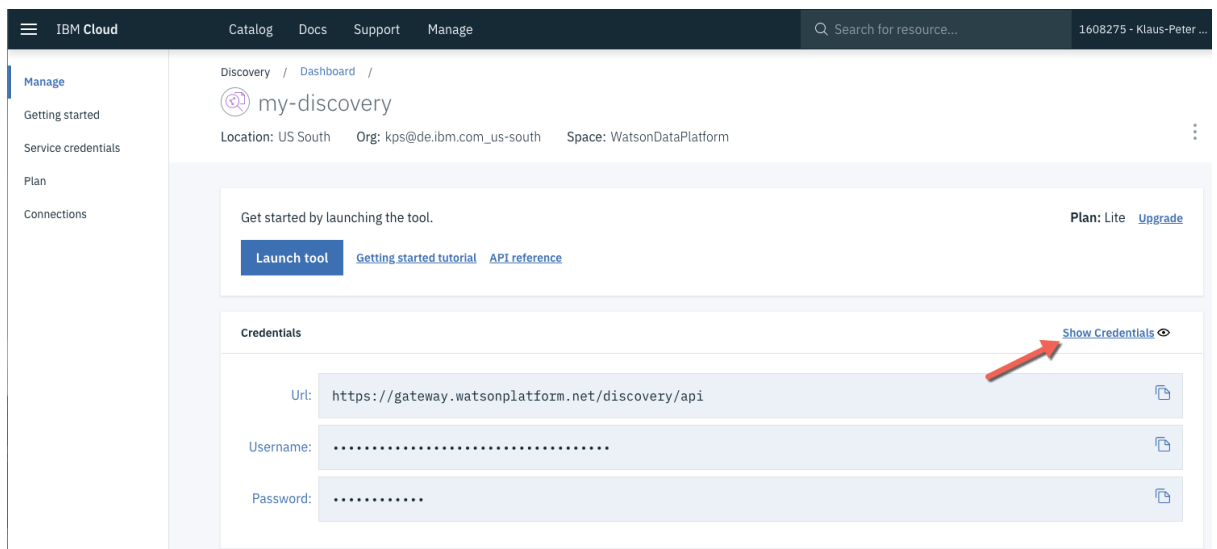

Step 6 Review the details for this service. At the top, there will be a description of the service. At the bottom, you can review the pricing plans. The Lite plan for this service provides no cost monthly allowances for workspaces, intents, and API calls. Enjoy your demo!

Step 7 At the top, you can enter information for your new service. In the middle, you can click on a pricing plan to select it. Fill out the fields as follows, then **click**  at the bottom.

Field	Value
Service name	my-discovery
Selected Plan	Lite

Step 8 IBM Cloud has created a new service instance.

Step 9 In the *Credentials* section **click** [Show Credentials](#) . You should see the username and password for your service. Later in this exercise, you will enter these values into a JSON configuration file for your Node.js application. Feel free to copy them to your clipboard, to a text file, or just return to this section of the IBM Cloud web interface when the credentials are needed.

Step 10 Click the [Launch tool](#) button to open the Discovery service configuration tool.

Step 11 **Select** your language and **click** on the *Watson Discovery News* collection, which is available in every service instance, to open it.

This collection is provided by IBM and gets updated daily, in German with approximately 40000 news articles per day containing a 60 day period of news (~ 3 Million entries).

On the overview page of the document collection you can see infos such as *Document count*, *Collection Info*, and *Insights from enriched data*. This enriched data is added by Watson when the documents get ingested.

The screenshot shows the IBM Watson Discovery interface. At the top, the header includes 'IBM Watson Discovery', 'Cookie Preferences', and 'Instance: my-discovery'. The main content area displays the document count '755,361 documents'. Below this, there are three main sections:

- About Watson Discovery News:** A table showing new articles per day by language.

Language	New articles per day
English	300,000
Spanish	60,000
German	40,000
Japanese	17,000
Korean	10,000
- Added 5 enrichments to your data:** Five cards showing enrichment results:
 - Entity Extraction:** Deutschland (70k), USA (50k), Schweiz (41k), Europa (35k), Der (35k)
 - Sentiment Analysis:** 44% positive, 12% neutral, 45% negative
 - Concept Tagging:** Deutschland (110k), Euro (86k), Vereinigte Staaten (84k), Schweiz (75k), Römischer Kalender (65k)
 - Category Classification:** law, govt and politic...
 - Keyword Extraction:** August (60k), Jahren (53k), Jahr (50k), September (41k), Bild (39k)
- Now you're ready to query!:** A list of query suggestions with 'Run' buttons:
 - Company acquisitions relating to artificial intelligence
 - Top 20 recently acquired artificial intelligence companies
 - Top 10 companies with positive sentiment
 - 50 most mentioned people in the Tech industry
 - Sentiment of articles about IBM over the last 60 days
 - News from Business Wire about Elon Musk

The *Use this collection in API* information is needed to access this information from your application, *Collection Id* and *Environment Id*.

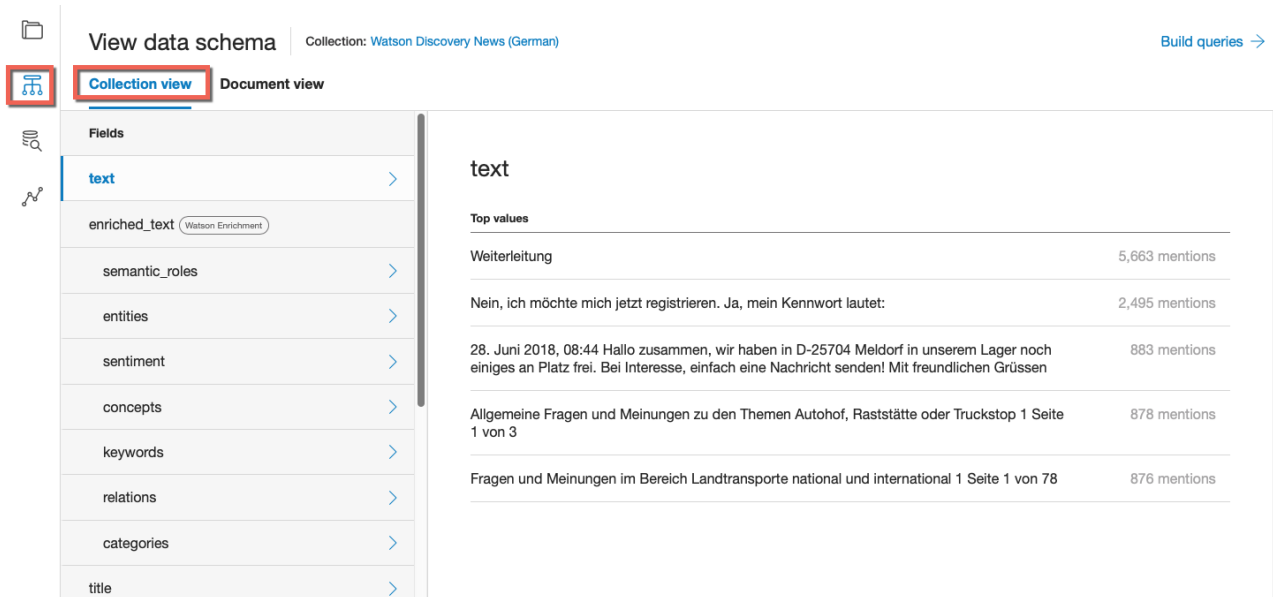

The screenshot shows a dialog box titled 'Use this collection in API'. It contains two input fields:

- Collection ID:** The value 'news-de' is entered, with a copy icon to the right.
- Environment ID:** The value 'system' is entered, with a copy icon to the right.

A red arrow points to the 'API' button in the top right corner of the dialog box. Below the dialog box, the text 'Now you're ready to query!' is visible, followed by a query suggestion: 'Company acquisitions relating to artificial intelligence'.

Step 12 On the *View data schema* page you can look at your collection in a

- a) *Collections View* which shows you a summary of the Watson Enrichments on the collection scope

View data schema | Collection: [Watson Discovery News \(German\)](#) | [Build queries](#) →

Collection view | Document view

Fields

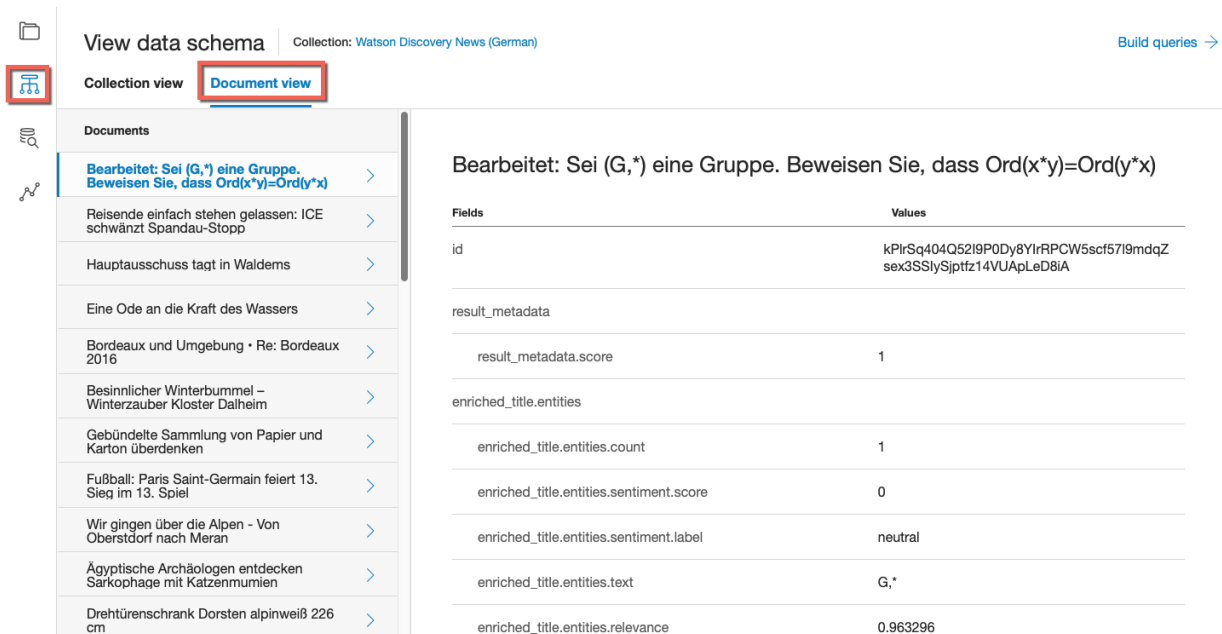

- text
- enriched_text (Watson Enrichment)
- semantic_roles
- entities
- sentiment
- concepts
- keywords
- relations
- categories
- title

```

Here is a nice video of the tutorial listed at the end of this document on how to work with the Discovery enriched-data to build powerful queries using this IBM News collection.

<https://www.youtube.com/watch?v=N-HalpPGde0&feature=youtu.be>

More information can be found in the documentation.

Step 15 On the *Performance* page you can see how your collection performs over time. Right now, there is no data available.

Section 2 Use the German collection with the Demo App

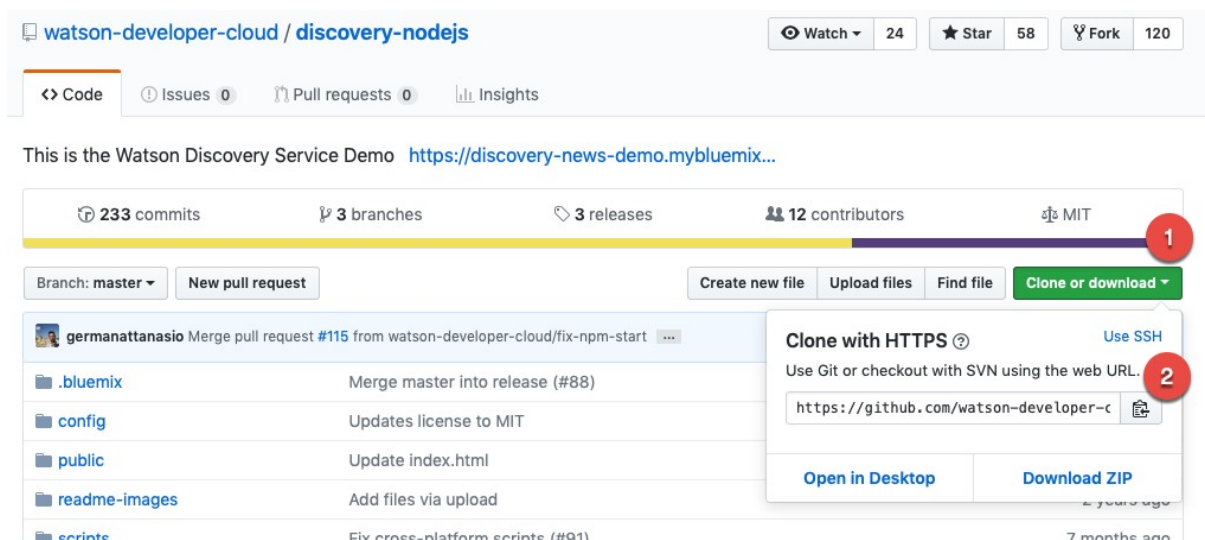

The Watson Discovery Demo can be found [here](#). It is an English web application that uses the IBM Discovery News collection in the English version. In the following we want to switch this collection to German.

Step 16 In a web browser open the URL

<https://discovery-news-demo.ng.bluemix.net>

Step 17 On the top of the page **click** the *Fork on GitHub* link.

Step 18 On GitHub **copy** the clone URL to the clipboard.

Step 19 In a terminal window in a folder where you want to store your projects type

`git clone <paste the url here>`

f.e. `git clone https://github.com/watson-developer-cloud/discovery-nodejs.git`

Step 20 **Move** into the new folder created by the clone command. It should be named *discovery-nodejs*.

Step 21 Copy the .env.example and create a file called .env. **Type**

`cp .env.example .env`

Step 22 Open the project in Visual Studio code or with your preferred IDE.

Step 23 In the newly created .env file fill in your credentials (Username/password or APIKEY; Step 9) and also *Environment Id* and the *Collection Id* (Step 11). See the readme of the GitHub page for username/password and APIKEY.

Step 24 Open the file *app.js* in the project's root folder. On line 3 you can leave the `NEWS_ENVIRONMENT_ID` as "system" and adjust line 4 `NEWS_COLLECTION_ID` to "news-de".

```
const NEWS_ENVIRONMENT_ID = 'system';  
const NEWS_COLLECTION_ID = 'news-de';
```

Step 25 Save and close the *app.js*.

Step 26 Open the file *query-builder.js*.

Step 27 Change the language in line 24 to

```
params.filter = `${fields.language}:(de)`;
```

Step 28 Save and close the file *query-builder.js*.

Step 29 In the terminal type to following commands to build and start the application.

```
npm install
```

```
npm start
```

Step 30 In the web browser open

<http://localhost:3000>

The web application that opens is still in English but now you can search for German text. As of November 2018 "Dieselfahrverbot" might be an interesting topic.

The screenshot shows a web application interface with a purple header. The search bar contains the text "Dieselfahrverbot". Below the header, there are two main sections: "Top Stories" and "Top Entities".

Top Stories

- Discovery can pull a list of the most recent and relevant news articles about this company.
- 9/26/2018 08:09pm
- [Dieselkrise: Hessen sieht kommenden Montag als Schicksalstag](#)
- fuldaerzeitung.de | Score: 15.959816
- 10/15/2018 11:10pm
- [Drohende Dieselfahrverbote in Essen - Ormeirat: Ohne blaue Plakette sind Dieselfahrverbote nicht kontrollierbar](#)
- lokalkompass.de | Score: 15.945722

Top Entities

- Discovery can easily extract frequently mentioned entities - such as people, topics and companies - from the set of articles.
- Topics Companies People
- Deutschland Aufklärung Vereinigte Staaten
- Schweiz Die Linke Sozialdemokratische Partei Deutschlands
- Angela Merkel Ladbergener Städtebund
- Oberlausitzer Sechsstädtebund Euro

For example you can also see Sentiment analysis

Sentiment Analysis

[View Query](#)

Sentiment can be extracted from news articles across a variety of sources.

and Anomaly Detection

Anomaly Detection

[View Query](#)

Anomalies - days with an unusually high number of mentions - can be detected in news articles over a specified timeframe.

You can use this constantly updated data in your applications.

In the next section we will enhance the Chatbot from Lab 3 with a custom document collection from the Discovery service.

Section 3 Integrate Discovery Service into a Chatbot

In this section we will integrate the Discovery Service into the Chatbot created in Lab 3.

If you have not done **Lab3** and you want to execute all the steps here, just clone the git branch of lab3 with the following command:

```
git clone -b lab3_csadConversation https://github.com/iic-dach/csadConversation.git
```

If you do not want to do all the coding steps described in the following, you can clone the completed repository from GitHub. Then just add your credentials in *config.js*.

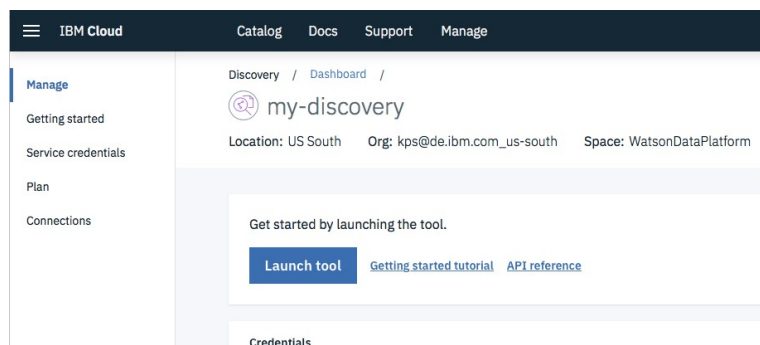

```
git clone https://github.com/iic-dach/csadConversation.git
```

Step 31 As a starting point for this section you should follow Lab 3 Section 1 and 3. These section will list shortcuts on how to get started quickly such as importing the Conversation workspace or cloning the app source code.

Create a Watson Discovery Document Collection

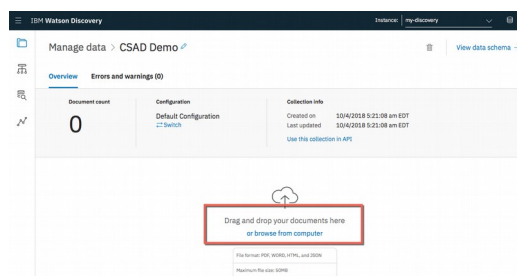

Step 32 Download the zip file manualdocs.zip from [github](#) (click the [Download](#) button) and extract it into a folder. It's a web manual for a Ford car.

Step 33 In your cloud console dashboard click on the “my-discovery” service created above and click the [Launch tool](#) button.

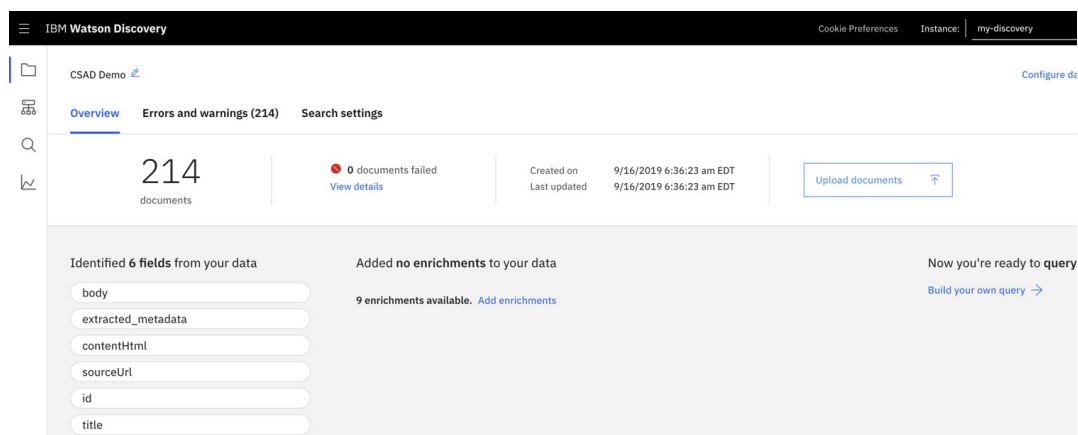

Step 34 On the *Manage data* page click [Upload your own data](#). As collection Name enter **CSAD Demo** and click [Create](#).

Step 35 The new collection opens and you can either **browse** or **drag 'n' drop** all the documents extracted above (234 json files).

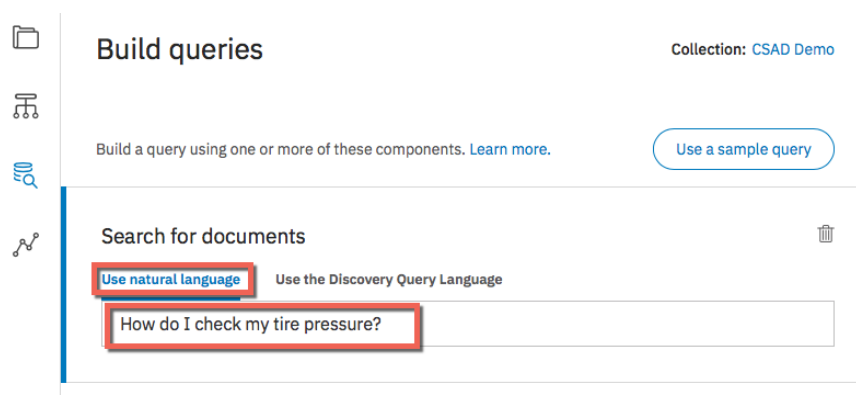

Step 36 The Discovery Service now indexes the documents. This may take a few minutes.

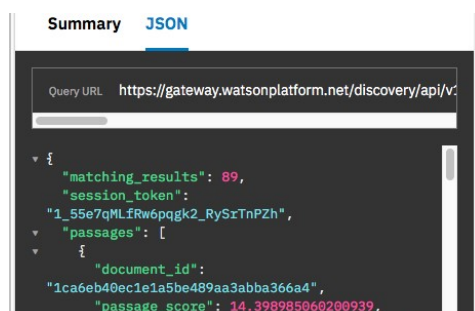

Step 37 On the left, click the  button to open the *Build queries* page.

Step 38 Enter the following query: How do I check my tire pressure?

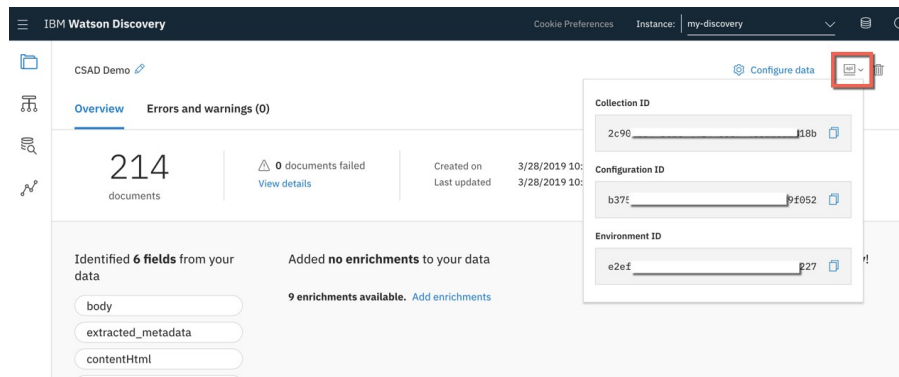

and press the  button.

On the left you can then see the results. Especially switch between the Summary and the JSON view of the results.

There is a lot more to explore here, but this is out of scope for this short tutorial. We just want to use the question submitted above later in our extended chatbot.

Step 39 On the top right of the **Overview** page **click**  to show the ids you have to copy for later use by the application in addition to the service credentials.

Step 40 Download the `out_of_scope_intents.csv` from the [Github repository](https://github.com/iic-dach/csadConversation/blob/master/resources/Out_of_scope_intents.csv) to your project folder. Use the following in the terminal:

```
wget https://github.com/iic-dach/csadConversation/blob/master/resources/Out_of_scope_intents.csv
```

Step 41 Go back to your Watson Assistant console that should still be open in the browser (Step 11)

Create a new intent `out_of_scope` and return to the list of intents. **Click** the  button to import the user examples from the file downloaded above.

131 examples will be imported.

Step 42 On the *Dialog* tab **click** the menu  button on the *Turn on* node and **click** *Add node below*. In the field *If bot recognizes type* `#out_of_scope`.

Note: Due to modularity we create the node in this location. Because this is also some kind of help question, it might be also appropriate, to insert this in the child tree of the *help* node.

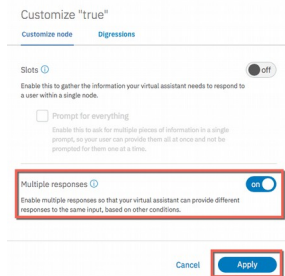

Step 43 Now **click** the menu  button on the `#out_of_scope` node. And **click** *Add child node*.

Step 44 In this child node, **name** it *Check out of Scope*, in *If bot recognizes*, just **type** `true`.

Step 45 Now **click** the menu  button on the `#out_of_scope` node. And **click** *Jump to (Recognizes Condition)*.

Step 46 Click the *Check out of Scope* node.

Step 47 Click  **Customize** and **enable** *Multiple responses*. Then click 

Step 48 Now you can add more than one answer.

Add the following:

If bot recognizes	Respond with
<code>intents[0].confidence>=0.94</code>	That question is out of scope for this application, take a look at the Conversation Enhanced application to handle questions like these.
<code>intents[0].confidence<0.94</code>	Sorry I haven't learned answers to questions like this.

Step 49 Now click the  and **enter** the following question:

Hi, how do I check my tire pressure?

This returns the first answer because it matches an `out_of_scope` intent.

Step 50 Now enter another question:

How do I check my account balance?

This returns the second answer because it only matches an `out_of_scope` intent to some degree.

This is not a very good solution because we only check the natural language and we do not have any entities assigned here. It works when you enter

How do I check my tire pressure – Similar to Hi, how do I check my tire pressure?

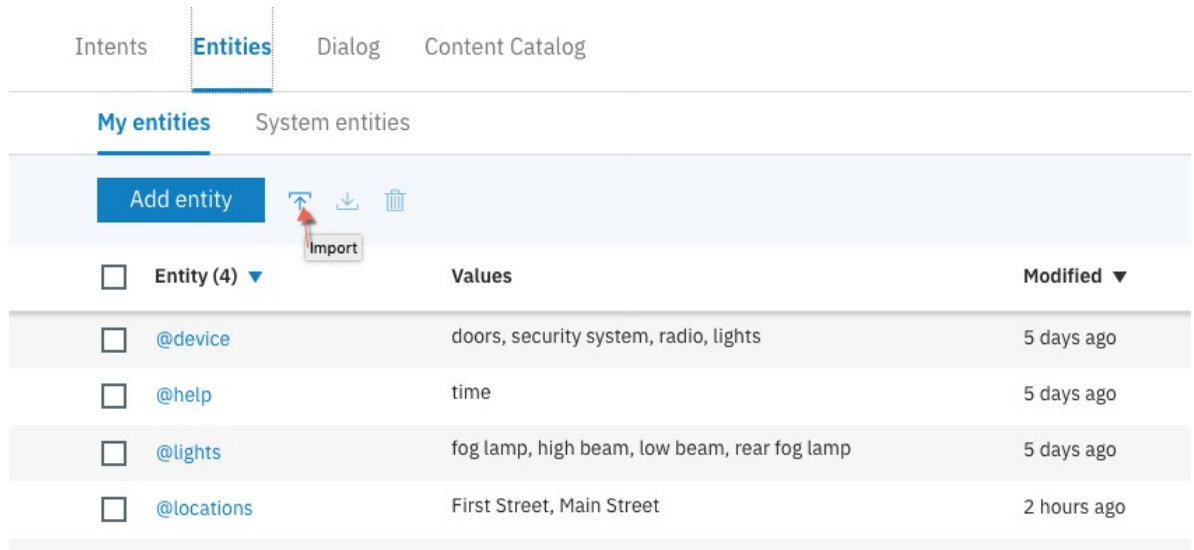

How do I check my blood pressure Is very similar to the above but <94%

I want to check my tire pressure would not work either (<50%) because no similar sentence is found in the intent.

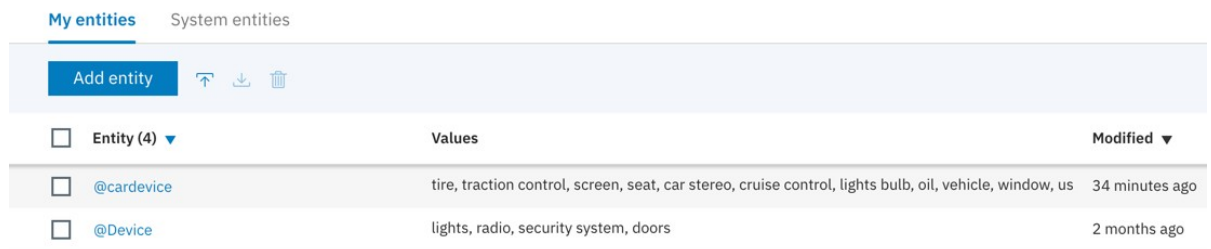

A solution would be just to add an entity @cardevice and add all the devices listed in the intent examples.

Step 51 In your Skill's Entities add an Entity by importing the cardevice_entity.txt CSV file.

```
wget https://github.com/iic-dach/csadConversation/blob/master/resources/cardevice_entity.txt
```

This will add an Entity @cardevice

Step 52 Now change the *Check out of Scope* node (Step 48) to the following

If bot recognizes	Respond with
@cardevice	That question is out of scope for this application, take a look at the Conversation Enhanced application to handle questions like these.
true	Sorry I haven't learned answers to questions like this.

Step 53 The backend is now adjusted for integrating the Discovery service into our chatbot application.

Step 54 Open the cloned repository in Visual Studio Code.

Step 55 In *config.js* enter the credentials and IDs from your Discovery service.
(If you cloned the lab3 repository you make a copy of the *config_sample.js*)

You can cut and paste from the [lab05_codesnippets.txt](#) file.

<pre>var config = { watson: { assistant: { username: "<yourServiceUsername>", password: "<yourServicePassword>", version: "2019-03-25", url: "<yourServiceUrl>", workspace_id: "<yourWorkspaceId>" }, discovery: { version: "2018-10-15", username: "<your discovery username>", password: "<your discovery password>", url: "<yourServiceUrl>" }, discoveryEnv: { collectionId: "<your collectionId>", environmentId: "<your environmentId>" } } }; module.exports = config;</pre>	<pre>var config = { watson: { assistant: { iam_apikey: "<yourApiKey>", version: "2019-03-25", url: "<yourServiceUrl>", workspace_id: "<yourWorkspaceId>" }, discovery: { version: "2018-10-15", iam_apikey: "<yourApiKey>", url: "<yourServiceUrl>" }, discoveryEnv: { collectionId: "<your collectionId>", environmentId: "<your environmentId>" } } }; module.exports = config;</pre>
---	---

Depending on your service, use *username/password* or *apikey*.

Step 56 In *controllers/watson.js* add a blank line after line 1.

Step 57 In line 2 add the following – this imports the discovery api

```
const DiscoveryV1 = require('ibm-watson/discovery/v1');
```

Step 58 Add a blank line after line 5

Step 59 In line 6 add the following – this creates an instance of discovery

```
const discovery = new DiscoveryV1(config.watson.discovery);
```

Step 60 At the end of the file add the Promise for the `discovery.query` function.

```
//convert discovery.query() to Promise
discoveryQuery = (params) => {
  return new Promise((resolve, reject) => {
    discovery.query(params, (error, result) => {
      if (error) {
        reject(error);
      } else {
        resolve(result)
      }
    })
  })
}
```

Refer to the following table for a description of the code:

Lines	Description
81	Function call with the appropriate parameters
82 – 90	Convert the function call with to a JavaScript Promise (.then() ... catch())

Step 61 Replace assistantMessage() with the following:

```
assistantMessage (assistantParam)
  .then(assistantResult => {
    let intent = null;
    let entity = null;

    if (assistantResult.intents.length > 0) {
      intent = assistantResult.intents[0];
      console.log("Detected intent: " + intent.intent);
      console.log("Confidence: " + intent.confidence);
    }
    if (assistantResult.entities.length > 0) {
      entity = assistantResult.entities[0];
      console.log("Detected entity: " + entity.entity);
      console.log("Value: " + entity.value);
    }
    if (entity != null && (entity.entity === 'help') && (entity.value === 'time')) {
      let msg = 'The current time is ' + new Date().toLocaleTimeString();
      console.log(msg);
      assistantResult.output.text = msg;
    }
    if (intent != null && intent.intent === "out_of_scope" && assistantResult.entities.filter(val =>
val.entity ==="cardevice").length > 0) {
      let discoveryParams = {
        'query': assistantResult.input.text,
        'environment_id': config.watson.discoveryEnv.environmentId,
        'collection_id': config.watson.discoveryEnv.collectionId,
        'passages': true,
        return: 'text, title, sourceUrl, passages'
      };
      discoveryQuery(discoveryParams)
        .then(discoveryResult => {
          console.log(discoveryResult);
          assistantResult.output.text = discoveryResult.passages[0].passage_text;
          return res.json(assistantResult);
        })
        .catch(err => {
          console.log('error:', err);
        });
      } else {
        // console.log(JSON.stringify(result, null, 2));
        res.json(assistantResult);
      }
    }
  })
  .catch(err => {
    console.log('error:', err);
  });
}
```

Lines	Description
21	Successful return from Watson Assistant with assistantResult
25	Check that there is an intent
30	Check that there is an entity
35	Check for the help entity with a time value
40	Check for #out_of_scope with a @cardevice
48	Call the Discovery service with appropriate parameters
51	On a successful return set the first text passage as the Assistant return message
59	When no Discovery is called, return what's set as the return message.
62	Catch any remote call error (networking, etc.)

Step 62 Save the file.

Step 63 In the terminal execute

```
npm install          – only if you have cloned the repo.
```

```
npm start
```

Step 64 In the browser open

<http://localhost:3000>

Step 65 Enter some statements into the Assistant input line:

Switch on the lights

The headlights

What time is it?

Where can I find my wallet?

How do I check my tire pressure?

IBM EAG Watson Assistant Lab

Send

Conversation History:
Watson: Welcome to CSAD Demo!
You: Switch on the lights
Watson: OK! Which light would you like to turn on?
You: The headlights
Watson: OK! Turning on low beam lights.
You: What time is it?
Watson: The current time is 16:53:58
You: Where can I find my wallet?
Watson: Sorry I haven't learned answers to questions like this.
You: How do I check my tire pressure?
Watson:

You can check the tire pressure any time within the 200 km by performing the procedure from Second stage: Checking tire pressure listed previously.

Be sure to check the sealant compound's use by date regularly.

IBM Ecosystem Advocacy Group - 2018

The question for the tire pressure should return the same as in **Step 48**, the first passage.

In the server console you should see the JSON returned from Discovery:

```
POST /assistant 200 427.064 ms - 787
Detected input: How do I check my tire pressure?
Detected intent: out_of_scope
Confidence: 0.9966614246368408
{ matching_results: 89,
  session_token: '1_55e7qMLfRw6YxeD3_WSvnHI082',

      field: 'contentHtml' },
      { document_id: '1f35b6c66512d6b0268ce3958186feb1',
        passage_score: 14.108820373007827,
```

Push your application to the IBM Cloud

See **Lab03 Step 127ff** on how to push your application to the IBM Cloud.

Tutorials using the Watson Discovery Services

Watson Discovery News Alerting

In this Code Pattern, we will build a Node.js web application that will use the Watson Discovery Service to access Watson Discovery News.

Watson Discovery News is a default data collection that is associated with the Watson Discovery Service. It is a dataset of primarily English language news sources that is updated continuously, with approximately 300,000 new articles and blogs added daily.

<https://www.youtube.com/watch?v=zFl-2FybDdY&feature=youtu.be>

<https://github.com/IBM/watson-discovery-news-alerting>

discovering news alerting (The Build Query tool):

<https://www.youtube.com/watch?v=N-HalpPGde0&feature=youtu.be>
